

Add the following section to the end of the master prompt

Marketing Website (Landing Page)

In addition to the Sender and Receiver applications, build a completely separate marketing website for the Optical Transport Platform (OTP).

This website is **not** the Sender or Receiver UI.

It is a standalone public website used for product promotion, documentation, lead generation, downloads, and customer onboarding.

Design an original premium SaaS website with a highly polished, modern experience featuring smooth animations, excellent typography, responsive layouts, and professional interactions. It should evoke the quality and feel of leading modern technology product websites while remaining an original design.

Tech Stack

- React
- Next.js
- TypeScript
- Tailwind CSS
- Framer Motion
- Three.js (where appropriate)
- GSAP (optional)
- MDX Documentation
- SEO Optimized
- Server Side Rendering
- Static Export Support

Containerize separately.

```
marketing-site/
```

```
Dockerfile
```

```
docker-compose.yml
```

```
README.md
```

```
.env
```

Deploy independently from Sender and Receiver.

Documentation Generator

Automatically generate API documentation from Go code.

Automatically generate protocol documentation from source definitions.

Docker

Provide independent deployment.

```
marketing-site/
```

```
Dockerfile
```

```
docker-compose.yml
```

```
nginx.conf
```

```
README.md
```

The website must run independently from Sender and Receiver.

Final Deliverables

Produce three completely independent deployable systems:

1. Sender Platform

2. Go API
3. React UI
4. PostgreSQL
5. Job Engine
6. Optical Display Engine
7. Dockerized

8. Receiver Platform

9. Go API
10. React UI
11. PostgreSQL
12. Job Engine
13. Camera Decoder
14. Callback Engine
15. Dockerized

16. Marketing Website

17. Next.js
18. React
19. Tailwind
20. Framer Motion
21. Documentation Portal
22. Interactive Architecture Visualizations

23. Dockerized

Generate the implementation incrementally with production-quality code, tests, documentation, Docker configuration, CI/CD examples, and deployment guides. Ensure each component is independently deployable while sharing a common, versioned protocol specification.
